Data Analyst – Tableau Assessment

Introduction

You are a Data Analyst specializing in Tableau, working for an office supply retailer. As part of the Data team, you collaborate closely with business stakeholders to deliver actionable insights and enable product teams to make data-driven decisions.

Your task is to create, using Tableau:

1. A Sales Data Source that supports a self-service reporting model, allowing end users to easily build ad-hoc reports.
2. A Global Sales Dashboard for executive stakeholders to quickly monitor overall sales performance (details below).

Available Data

The Data Engineering team has provided several tables, modeled according to data warehousing best practices:

- **Order Dimension** – Contains all orders and their attributes
- **Product Dimension** – Contains product details and attributes
- **Customer Dimension** – Contains customer details and attributes
- **Sales Fact Table** – Contains order-product-level transactions, including the following metrics:
    - Sales
    - Quantity
    - Discount
    - Profit

Data Source Requirements

Create a Tableau data source that enables users to build analytical reports efficiently. Consider the following best practices:

- Use clear and meaningful field names
- Expose only relevant attributes for reporting
- Organize fields logically (e.g., by dimension or metric)
- Add calculated fields or metrics where useful (e.g., Revenue, Discount %, etc.)

Dashboard Requirements

Develop a Global Sales Dashboard containing the following visualizations:

- Top 5 Profitable Products
    - Include a drill-down to view individual orders for a selected product.
- Month-over-Month Revenue Trend
- Customer Sales Map
    - Display customers by sales amount (color scale) and number of orders (size or tooltip).
    - Enable drill up/down by Country → State → City.
- Total Revenue by Customer Segment
- Average Shipping Days
    - Compared by Shipping Mode and Country.

Bonus:

If you identify additional metrics or insights that could be valuable, feel free to visualize them as part of your dashboard.

Dashboard Filters

The dashboard should allow users to filter results by:

- Order Date Range
- Product Category

Hints

- Consider whether the order was returned.
- Pay attention to the discount percentage applied to orders.

Submission Guidelines

Please submit your solution in PDF or presentation format and include an ERD diagram. Provide a Tableau (.tdsx) file containing:

- The configured data source
- All supporting worksheets
- The final dashboard
