Introduction to the Global Retail Dashboard

GLOBAL RETAIL DASHBOARD

This dashboard provides a high-level view of global sales performance.

It is designed to support both executive monitoring and self-service analysis by enabling users to explore sales, profitability, and customer behavior across products, regions, and time.

Key features include:
• Revenue performance trends over time
• Top and bottom performing products based on profitability
• Revenue contribution and distribution across geographies
• Order fulfillment insights such as shipping performance and returns

Interactive filters allow users to refine the analysis by order date, product category, discount thresholds, and return status.

All metrics dynamically update based on selected filters, enabling scenario-based analysis and informed decision-making.

METRIC DEFINITIONS

Revenue
Total sales value generated from orders after discounts are applied.
Calculated as: Price Per Unit × Quantity × (1 − Discount)

Profit
The financial gain from sales after costs are accounted for.
Provided directly from the source data.

Profit Margin
The percentage of revenue that is retained as profit.
Calculated as: Profit ÷ Revenue.
A higher margin indicates more profitable sales.

Discount
The percentage reduction applied to the product's price.
Example: A discount of 0.20 represents a 20% discount.

Shipping Days
The number of days taken to ship an order from the order date to the ship date.
Calculated as: Ship Date − Order Date.

Order Count
The total number of unique customer orders.
Based on distinct Order ID values.

Returned / Not Returned
Indicates whether an order was returned by the customer.
Returned – The order was returned.
Not Returned – The order was successfully completed.

Customer Segment
A classification of customers based on business-defined segments.

Product Category / Sub-Category
Product grouping used to organize items into broader categories for analysis.

Shipping Mode
The method used to ship the order (e.g., Standard, Second Class, Same Day).

DISCOUNT SCENARIO FILTER

The "**Include Orders with Discount ≤ (%)**" slider allows users to explore how sales performance changes when higher-discounted orders are excluded from the analysis.

Selecting a lower percentage filters the dashboard to include only orders with discounts less than or equal to the selected value. Setting the slider to 100% includes all orders and removes the discount-based filter.

This control enables scenario analysis to understand the impact of discounting on revenue, profitability, and product rankings.

FOOTNOTE

** All metrics are calculated at the order level and aggregated base..
